MARVELLOUS UMEILECHUKWU

DATA ANALYST

marvellousug7@gmail.com | London, UK | linkedin.com/in/marvel7 | github.com/Marvllous

PROFESSIONAL SUMMARY

Data Analyst who turns unstructured operational and financial data into decisions people act on. Across project and operational work I have moved a $636.68M loan portfolio review from a collections problem to an underwriting one, reattributed 69% of a manufacturer's unplanned downtime away from operator error to systemic causes, and moved the daily route finish time from between 13:00 and 15:00 to around midday at a last mile delivery station holding a 99.6% fulfilment rate. I model raw source data into structures that support analysis, build the measure layer on top, and test assumptions rather than confirming them. Every figure is validated against a control total before it reaches a stakeholder.

TECHNICAL SKILLS

SQL: Microsoft SQL Server (CTEs, UNPIVOT, DATEDIFF, CASE logic, multi-table joins, views), PostgreSQL

Business Intelligence: Power BI (Power Query, DAX, star schema data modelling, calculated columns, conditional formatting by measure, multi-page dashboards with cross-filtering and slicers)

Data Modelling: Dimensional modelling (star schema, fact and dimension design), semantic layer design in DAX, key integrity validation, relationship configuration and cardinality, date tables, dedicated measures tables

Microsoft Excel: Advanced: pivot tables, lookups, INDEX/MATCH, SUMIFS, COUNTIFS, Data Model relationships, calculated fields, dashboards with slicers, large dataset handling

Data Preparation: Data cleaning, data type conversion, text standardisation, table restructuring, multi-source merging, data quality assessment, control total validation

Analysis: Root cause analysis, KPI definition and reporting, trend analysis, segmentation, risk and exposure concentration, weighted scoring and normalisation, retention and churn analysis, performance benchmarking, ad hoc analysis

Stakeholder and Delivery: Requirements gathering with non-technical stakeholders, translating business questions into analysis, presenting findings to operational and senior management, data visualisation and dashboard design, reporting automation, documenting analytical limitations

PROFESSIONAL EXPERIENCE

Logistics Operations Associate | JD.com, United Kingdom Jul 2025 - Present

Operational reporting and analysis for a last mile delivery station, covering fulfilment, pickup, route performance and customer experience.

- Built and maintain the daily, weekly and monthly reporting on core delivery KPIs, read each morning by station and regional management, and respond to ad hoc data requests off the back of it
- Reporting supported a 99.6% fulfilment rate that ranked the station Top 5 across the EU network and a 100% pickup rate on customer returns collection that reached the No. 1 position across the EU network
- Rebuilt route allocation after finding drivers were working from lists with no geographic logic. Exported the route data and used pivot tables to group 200+ daily stops into postcode clusters, balancing route size against distance so each driver covered one contiguous area instead of crossing the patch. Routes that previously ran to between 13:00 and 15:00 now finish around midday against a 15:00 cutoff, on the same daily volume
- Conducted root cause analysis on customer complaint data and implemented corrective actions based on the findings, reducing complaint volume and ranking the station Top 10 across the EU network
- Provided the operational analysis supporting a pilot third delivery wave, adding a 19:00 round on top of the station's existing morning and afternoon waves. Ours was the first station across the EU network to run it

Tools: *Excel (pivot tables, performance benchmarking), operational KPI reporting*

Data Analyst | Amdari, United Kingdom Feb 2025 - Present

Applied analytics programme, project delivery. Supplied industry datasets, each scoped to a business brief and delivered end to end. Full documentation, SQL queries, DAX, dashboards and raw source data for all three are published and reproducible.

Loan portfolio risk and default concentration | Power BI, DAX | 2026

- Modelled a 5,000 record bank loan portfolio held in one flat table of 37 columns with no structure behind it, building a star schema of one fact table and six dimensions and testing every key for conflicting attributes before collapsing duplicates
- Built DAX measures covering lending volume, repayment, default rate and exposure across $636.68M of lending, added a calculated column bucketing loan ageing into 30 day bands, and delivered a two page Power BI dashboard covering profit and loss with cross-filtering and thresholds that flag themselves
- Established that 93.8% of the bank's 209 defaults came from a single customer segment holding 29% of lending, and that mortgage carried 88% of outstanding balance against under 10% of the failures, separating where the money sat from where the risk sat and redirecting the recommendation to underwriting rather than collections

Production downtime attribution | Microsoft SQL Server, Power BI | 2025 - 2026

- Analysed unplanned production downtime for a manufacturer losing an estimated $1.5M annually with no visibility on the cause, working across four related SQL Server tables covering batches, downtime events, factor definitions and products
- Restructured 13 wide downtime factor columns into rows that could be grouped and joined using UNPIVOT, which made the data usable for the first time, then compared actual against planned batch duration to establish that 56% of 645 batches ran late and 21.74 days of production time was lost
- Tested the prevailing belief that operator error drove the downtime by splitting all 885 events against the factor reference table, and proved 69% were non-operator, moving the corrective focus to maintenance scheduling, supply and cleaning cycle planning
- Measured each operator's delay rate as a proportion of their own batches rather than by raw count, which separated those simply running more work from those genuinely running late, and delivered a three-page Power BI dashboard with product, operator and date filtering for ongoing monitoring

Sales, margin and order fulfilment | Excel | 2026

- Reconciled 259 raw rows to 250 unique orders, standardised a status field stored in 15 different spellings, and corrected two order IDs carrying internal spaces that would have broken every lookup built on them
- Rebuilt profit at line level for a beverage distributor across 250 orders and €12,960.50 in gross sales at a 44.4% margin, cleaning inconsistent text fields, converting dates held as serial numbers and joining three disconnected tables on ID
- Segmented margin across product, channel preference, region and customer type, establishing that customers who prefer a single ordering channel carry 36.8% of revenue, twice the next group, and validated every summary figure against a control total before delivery, surfacing a fulfilment anomaly affecting almost 20% of orders that was reported separately rather than folded into the revenue findings

PROFESSIONAL DEVELOPMENT

10Alytics, United Kingdom 2026 - Present

Applied analytics programme, skills development. Instructor-led curriculum taken alongside full-time work, running from problem framing through to a capstone project.

- Excel: analytics, data cleaning and dashboard build
- Power BI: data modelling, DAX, intermediate dashboarding and Power BI Service
- SQL: relational database design, querying, functions and analytical SQL
- Tableau: time series analysis and dashboarding
- Microsoft Fabric, Python and AI-assisted analytics

CERTIFICATIONS

- Google Data Analytics Professional Certificate, 2026
- Supply Chain Logistics, Rutgers University via Coursera, 2025

EDUCATION

MSc Project Management | Ravensbourne University, London 2024 - 2025

LLB Law | Igbinedion University, Edo State, Nigeria 2017 - 2021
